## North Dakota American Indian Health Profile

## POPULATION

The Demographic Section of this report comes from the US Census Bureau (www.census.gov). Most tables are derived either from the full ( $100 \%$ ) census taken in 2010 or from the Community Population Survey for 2010. The table showing percent population change uses census data from 2000 and 1990 also. Tables present number of persons and percentages which in almost all circumstances represent the category specific percentage of all persons referenced by the table (e.g., percentage of persons age 15 and older who are married). Age specific poverty rates represent the percentage of each age group which is in poverty (e.g., percentage of children under five years in poverty).

| Population by Age Group |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |

## Vital Statistics Data

## BIRTHS AND DEATHS

Vital Statistics Data comes from the birth and death records collected by the State of North Dakota for 2010. All births and deaths represent the state of residence not the state of occurrence. Formulas for calculating rates and ratios are as follows:
Birth Rate $=$ Resident live births divided by the total resident population x 1000.
Pregnancies $=$ Live births + Fetal deaths + Induced termination of pregnancy.
Pregnancy Rate $=$ Total pregnancies divided $b$ the total resident population $\times 1000$.
Fertility Rate = Resident live births divided by female population (age 15-44) x 1000.
Teenage Birth Rate $=$ Teenage births (age $<20$ ) divided by female teen population $\times 1000$.
Teenage Pregnancy Rate $=$ Teenage pregnancies (age<20) divided by female teen population x 1000.
Out of Wedlock Live Birth Ratio = Resident OOW live births divided by total resident live births x 1000.
Out of Wedlock Pregnancy Ratio = Resident OOW pregnancies divided by total pregnancies x 1000.
Low Weight Ratio $=$ Low weight births (birth weight $<2500$ grams) divided by total resident live births x 1000.
Infant Death Ratio = Number of infant deaths divided by the total resident live births x 1000.
Childhood \& Adolescent Deaths = Deaths to individuals 1-19 years of age.
Childhood and Adolescent Death Rate = Number of resident deaths (age 1-19) divided by population (age 1-19) x 100,000.
Crude Death Rate $=$ Death events divided by population x 100,000
Age-Adjusted Death Rate $=$ Death events with age specific adjustments x 100,000 population.

BIRTHS AND DEATHS

## ADULT BEHAVIORAL RISK FACTORS, 2006-2010

Adult Behavioral Risk Factor data are derived from data from 2010 when available, or 2009 otherwise. The survey is continuously collected by telephone survey from persons 18 years and older. All data is self-reported data. Numbers given are point estimate percentages followed by $95 \%$ confidence intervals. Statistical significance can be determined by comparing confidence intervals between two geographic areas. To be statistically significant, confidence may not overlap. For example the confidence intervals 9.3 (8.3-10.2) and 10.8 (10.0-11.6) overlap (see picture below) so the difference between the two numbers is not statistically significant. That means that substantial uncertainty remains whether the apparent difference is due to chance alone (due to sampling variation) rather than representing a true difference in the prevalence of the condition in the two populations. The less they overlap, the more likely it is that the point estimates represent truly different prevalences in the two populations.

## CANCER INCIDENCE AND MORTALITY, 2008

Cancer incidence data is derived from high quality state cancer registries, including North Dakota. Mortality of specific cancers is derived from vital statistics data. Data is shown for common cancers for which a preventive action exists to prevent disease or death.

Female Breast Cancer Incidence by Race, 20052009

[^0]:    *US statistics: Identification of race may vary from state method.
